

Leadership Self-Assessment Reflection

Reflecting on the results of both self-assessments helped me develop a clearer understanding of my current leadership capabilities and the areas where I still need to grow. The AI/ML Integration Leadership Skills Assessment was especially revealing because my highest scores were only 65% in stakeholder communication and 55% in both technical understanding of AI/ML and continuous improvement. While these were my strongest areas, they represent a developing level of proficiency rather than expertise. This honestly reflects where I am today. I have a foundational understanding of AI concepts and can communicate them effectively, but I recognize that I need much deeper technical and leadership knowledge. My lowest scores in AI/ML project management, AI/ML adoption strategies, change readiness, and ethical AI practices confirmed that I need more experience planning, implementing, and governing AI initiatives. These results reinforced why I chose to pursue a master's degree in Artificial Intelligence with a specialization in Data Analytics, to gain the knowledge and practical skills needed to lead AI initiatives confidently.

The Change Management Skills Assessment presented a different profile of strengths. My highest scores were flexibility and adaptability (84%), emotional intelligence (80%), and continuous learning (80%). These results closely align with my current organizational experience, as I am actively navigating a transition to a new operating partner. Participating in this change has strengthened my awareness of how leadership behavior directly influences team stability and engagement during periods of uncertainty.

At the same time, lower scores in change management knowledge (53%), planning and organization (60%), and project management (60%) indicate a gap between adaptability and structured execution. While I respond well to change, I recognize the need to strengthen my ability to apply formal change management frameworks, develop structured implementation plans, and engage stakeholders more systematically throughout transformation efforts.

Overall, I found both assessments to be valuable self-reflection tools because they encouraged me to evaluate my current skills honestly and identify specific areas for professional development. However, since the assessments rely entirely on self-ratings, I believe they would be more effective if they also included feedback from supervisors, colleagues, or team members to provide a more balanced perspective.

Based on the assigned readings, I would revise both assessments by adding questions about measuring the success of change initiatives, managing employee resistance, building organizational trust, AI governance, and evaluating the business value of AI projects. These additions would better reflect the leadership competencies needed to successfully guide organizations through technological and organizational change.
